

CIS PD Day

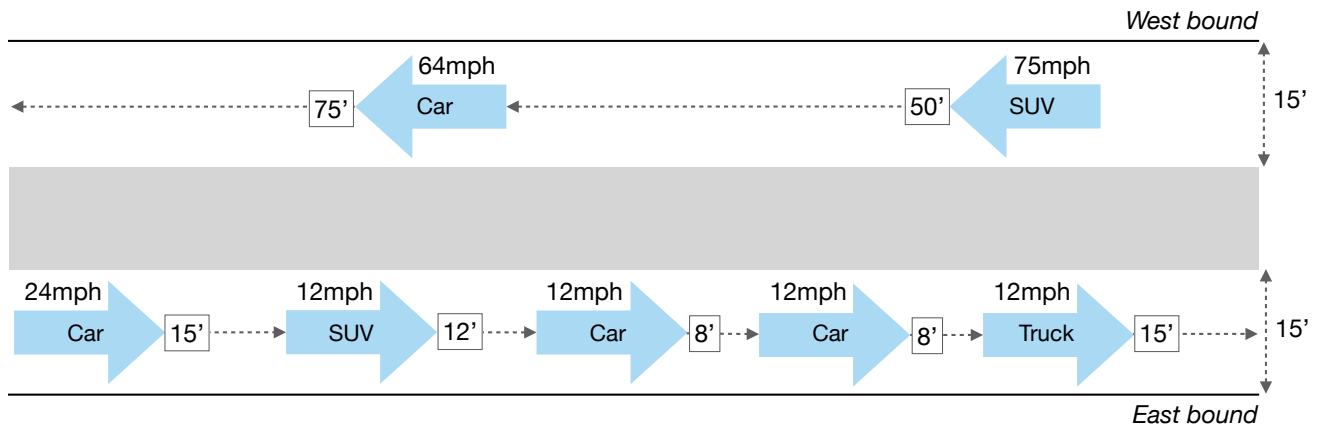

Fall 2021

Planners for the city of Tree Hill are studying the traffic along roads that lead into and out of the city. As a part of that study, they collected snapshots of the roads at various times of the day along short road segments (see figures on next page). The snapshots include all of the information the planners want collected.

Within these snapshots, each vehicle is depicted as an arrow with the type of vehicle inside the arrow, speed above the arrow, and traveling the direction the arrow is pointing. There is also information provided about the road segments (segment, lane width, direction) and the day and time the snapshots were collected.

Your task is to create one or more organized (tidy) data sheets by recording the data from the snapshots. These data sheets should easily allow the city planners to add additional data to the sheets.
